TRUNK

Why raw frequency is useless, and what replaces it

Every chain starts at the same person, so her father, grandfather and their line appear in almost every path and top any plain count. They are not connectors — they are the only road out. The separator is

depth spread

: how many different step-depths a person is reached at. Always reached at the same depth means one route in. Reached at several depths means several branches arrive there, and that is what a connector is.

Junctions

1,235 people · spread 1–5

A few branches converging. **These are the super-connectors.** Connecting one buys every branch that meets there, which is why they are worth more than their count suggests. Note what they are: the points where the Norwegian line meets European royalty, and a handful of Swedish and Pomeranian families doing the same job at shallower depth.

4,610 people · spread 6+

A long line entered at many different points — a dynasty walked from both ends. Big numbers, low leverage per person: they are links in a chain rather than a meeting of branches, so connecting one moves only the line it belongs to.
